

Capstone Reflection

- The first thoughts that comes to mind when working on this project is how all the classes from information science all tie in together. It shows what areas a strengths and weakness are at.
- While working on this project I saw what areas that I was weak at, like coding. I could not do this project if I don't have any reference or examples to work from.
- Coding was the most challenging of this project. I am not strong in coding
- Learning how everything tie together when making a web page or a website, along with everything that is used to get a website to run.
- From the beginning of the project, I knew I had to come up with the best solution. Being the only one working on the project.
- It makes a person feel good to come up with a solution to a situation or a problem.
- Currently there is nothing in the way of the project.
- Being the only one working on this project. I would have no problem with communication, collaboration, or team at this time.
- At this time the only milestones and goals for this project is to finish the project with the goals I set in the system analysis and design plan.
- My greatest strength was putting together the design plan for the project.
- My biggest improvement while working on this project is my coding. This project and all the resources used in this project have improved some of my skills.
- I will be proud when the project is finish.
- I could teach some problem-solving process, but not in information science. My skills in information science not that strong currently.
- I don't work with a group on this project.
- I would like to improve my information science skill level.
- At this time, I would not know what would better support or encourage my teammates.
- The more I learn how to use my skills, the more my skill level improve for the future.
